V1 Data preparation

This document was prepared in Overleaf, as an Rtex file implementing knitr. Any output is generated by R during compilation, and can thus be replicated by entering the same commands referencing the same dataset. Overleaf's R version and selection and versions of packages are not under the user's control. This section demonstrates the R version and the list of packages used for calculations and output generation.

V1.1 R Libraries

```
library(foreign)

library(formatR)
library(ggplot2)
library(dplyr)

##
## Attaching package: 'dplyr'
## The following objects are masked from 'package:stats':
##
##   filter, lag
## The following objects are masked from 'package:base':
##
##   intersect, setdiff, setequal, union

library(tidyr)
library("purrr")
library("tidyverse")

## - Attaching packages ----- tidyverse 1.3.0 -
## v tibble 3.0.3    v stringr 1.4.0
## v readr 1.3.1    v forcats 0.5.0
## - Conflicts ----- tidyverse_conflicts() -
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()

library("psych", verbose=TRUE)
```

```
##
## Attaching package: 'psych'
## The following objects are masked from 'package:ggplot2':
##
##   %%, alpha

library("rmarkdown", verbose=TRUE)

library("viridis")

## Loading required package: viridisLite

library(viridisLite)

library(car)

## Loading required package: carData
##
## Attaching package: 'car'
## The following object is masked from 'package:psych':
##
##   logit
## The following object is masked from 'package:purrr':
##
##   some
## The following object is masked from 'package:dplyr':
##
##   recode

library(data.table)

##
## Attaching package: 'data.table'
## The following object is masked from 'package:purrr':
##
##   transpose
## The following objects are masked from 'package:dplyr':
##
##   between, first, last

#library(sjmisc)

```

V1.3 Variables and scales

This document contains analyses for all scales and variables included in the study, including exploratory measures that were not covered in the main manuscript. The rationale for this is to offer these variables and analyses for researchers with specific interest in these measures collected at the time of our study and their inter-relationships. We present some analyses in the SM-A document to demonstrate that a cursory analysis does not raise any warning flags for our main analyses.

V2 Exclusion of participants and sample selection

A total of 1,525 attempts were made to start the task (including double attempts by the same person). A total of 122 attempts were stopped due to a suspicious IP-address flagged by the VPN checks. In addition, 64 were stopped due to the location of the user not being within the United States. These attempts were made from Australia, Bangladesh, Canada, Czech Republic, Spain, Great Britain, Nigeria, New Zealand, Poland, Portugal, and Venezuela. Seven attempts were identified as overlapping in IP address or Prolific IDs with attempts made from one of those countries (these participants suppressed the browser location in a later attempt). Several attempts did not pass the attention checks: 91 attempts failed both attention checks, 100 the first attention check and 181 the second attention check. Six attempts were from participants who had already attempted the attention checks twice before.

Further, 6 attempts did not even reach the first page of the survey, 11 participants did not pass the consent form, 2 stopped before the game instructions, and 46 stopped during the game instructions. After the game, 12 more participants dropped out before reaching the end of the study. A total of 37 participants made too many errors (more than 25) when responding to the comprehension check questions during the instructions (this threshold was hard-coded into the survey-flow). Another 4 attempts were from participants who had failed the comprehension checks before. Another 2 attempts were discarded, because two participants from the same IP address completed the survey simultaneously (data independence could not be assumed here). Another 3 attempts were made from IP addresses who had already completed full surveys. A further 2 attempts involved participants who had seen instructions in an earlier, incomplete attempt. Eleven attempts did not pass a quality check concerning open-format answers: There was either non-coincidental overlap with other attempts, copy-paste responses from irrelevant webpages, simply strange, incoherent, or ungrammatical responses.

A total of 819 cases were used in all calculations. The planned sample size was $n = 800$ with an equal division into the two framing conditions, two intervention conditions, and two voter groups. The final sample was slightly larger, as some of the filtering analysis had to be conducted with completed surveys (described above). Thus, the number of participants in conditions was unevenly distributed, and simultaneous starting points led to more participants in some conditions than planned. In all of these cases, the excess participants were informed about the technical problem, and received the average outcome for participants in their condition (that were achieved in the respective simulated game). This was fully communicated after the study.

V3 Distribution of single-item measures

V3.1 Demographics

V3.1.1 Gender

```
ggplot(df, aes(x=demo01Gender))+  
geom_bar(aes(y = ..count..), stat="count")+  
  geom_text(aes( label = (..count..),  
                y= ..count.. ), stat= "count", vjust = -0.25)+  
  coord_flip()
```

Figure V1
Gender distribution

V3.1.2 Age

```
summary(df$demo01Age)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##  19.00  27.00   33.00   36.16  42.00   76.00
```

```
df %>%
  ggplot(aes(demo01Age)) +
  geom_histogram(aes(y = ..count..), color="#000044",
                 fill="white", bins=40)
```

Figure V2
Age distribution

V3.1.3 Education

```
ggplot(df, aes(x=demo02Education))+
  geom_bar(aes(y = ..count..), stat="count")+
  geom_text(aes( label = (..count..),
                y= ..count.. ), stat= "count", vjust = -0.25)
```

V3.2 Postquestionnaire

V3.2.1 *General motivation*

Eleven questions were answered on a scale from 1–5: Strongly disagree—Disagree—Neither agree nor disagree—Agree—Strongly agree.

- **Post01:** I wanted to make as much bonus money as possible.
- **Post02:** I wanted to make more bonus money than other players.
- **Post03:** I felt responsible for other players.
- **Post04:** I wanted to make other players switch color.
- **Post05:** I was afraid to switch color in this game.
- **Post06:** I tried to anticipate what others were doing in this game.
- **Post07:** I followed my gut in this game.
- **Post08:** I wanted to take some risk in this game.
- **Post09:** I wanted to protect others in this game.
- **Post10:** I did not care at all what happened in this game.
- **Post11:** I wanted that the entire group receives as much money as possible.

V3.2.4 Specific Postquestionnaire: Injunctive norms

Six questions were answered on a scale from 1–6: Strongly disagree—Disagree—Slightly disagree—Slightly agree—Agree—Strongly agree.

- **PostIN1:** I liked the message.
- **PostIN2:** The message was easy to understand.
- **PostIN3:** The message influenced my decisions in the game.
- **PostIN4:** The message was a waste of my time.
- **PostIN5:** Without the message I would have tried to score more points (by choosing action H and 40 points more often).
- **PostIN6:** I would have chosen action H (40 points) less often, if I had not received this message.

V5 Scales without subscales

V5.1 Collective Narcissism

V5.1.1 Source

The five-item Collective narcissism scale was adapted from de Zavala et al. (2009). Responses were given on an 6-point scale: I strongly disagree 1—2—3—4—5—I strongly agree 6.

V5.1.2 Items

Please read each statement and decide how much you agree or disagree with that statement.

- **CN1+**: The United States deserves special treatment.
- **CN2+**: Not many people seem to fully understand the importance of the United States.
- **CN3+**: It really makes me angry when others criticize the United States.
- **CN4+**: If the United States had a major say in the world, the world would be a much better place.
- **CN5+**: I will never be satisfied until the United States gets the recognition it deserves.

V5.1.3 Item preparation

SVO: histogram of scores

V5.3 Psychological reactance scale

V5.3.1 Source

We used a refined, 11-item version of the Hong psychological reactance scale Hong and Faedda, 1996. Items were answered on a five-point scale from 1–5: strongly disagree (1) —(2)—neither agree nor disagree (3) —(4)—strongly agree (5)

V5.3.2 *Items*

- **PR01:** Regulations trigger a sense of resistance in me.
- **PR02:** I find contradicting others stimulating.
- **PR03:** When something is prohibited, I usually think "that's exactly what I am going to do."
- **PR04:** I consider advice from others to be an intrusion.
- **PR05:** I become frustrated when I am unable to make free and independent decisions.
- **PR06:** It irritates me when someone points out things which are obvious to me.
- **PR07:** I become angry when my freedom of choice is restricted.
- **PR08:** Advice and recommendations induce me to do just the opposite.
- **PR09:** I resist the attempts of others to influence me.
- **PR10:** It makes me angry when another person is held up as a model for me to follow.
- **PR11:** When someone forces me to do something, I feel like doing the opposite.

Psychological reactance scale: histogram of scores

V5.4 Social distancing support

V5.4.1 Source

The four-item Social distancing support scale is the scale titled "Support for Public Health Initiatives to Reduce Spread of COVID-19" taken from Lardone et al. (2020). Responses were given on a seven-point scale: Strongly disagree—Disagree—Somewhat disagree—Neither agree nor disagree—Somewhat agree—agree—Strongly agree.

V5.4.2 Items

Please read each statement and decide how much you agree or disagree with that statement.

- **SDS1-**: The social distancing restrictions being put into place to stop the spread of Covid-19 are doing more harm than good.
- **SDS2-**: We need to prioritize going back to our normal routines as soon as possible, regardless of COVID-19's spread.
- **SDS3+**: Right now the most important thing we can do is take all measures possible to stop the spread of COVID-19.

- **SDS4+**: It is essential that we strictly practice social distancing as a nation, until health care experts say otherwise.

Social distancing support: histogram of scores

V5.5 COVID-19-Misinformation

V5.5.1 Source

Items "CVMI01+" and "CVMI03+" were copied from an earlier version of Pennycook et al. (2021). Item "CVMI04+" was taken from Geldsetzer (2020), item "CVMI07-" was inspired by and adapted from this source.

V5.5.2 Items

Items were presented answered on a six-point scale (1–6): Extremely unlikely—Moderately unlikely—Slightly unlikely—Slightly likely—Moderately likely—Extremely likely.

- **CVMI01+**: The seasonal flu is just as dangerous as COVID-19.
- **CVMI02+**: Warm weather effectively stops COVID-19 from spreading.
- **CVMI03+**: A cure for COVID-19 has already been discovered but is being suppressed by people who want the pandemic to continue.
- **CVMI04+**: The current coronavirus is a bioweapon developed by a government or a terrorist organization.
- **CVMI05+**: Most people are immune to COVID-19.

- **CVMI06+**: The United States has tested a larger percentage of its population than any other country has.
- **CVMI07-**: People above the age of 60 are at a higher risk from COVID-19.
- **CVMI08-**: There is no vaccine against COVID-19.
- **CVMI09+**: The US has a lower absolute number of COVID-19-related deaths than many European countries.
- **CVMI10+**: God has sent COVID-19 to punish sinners.

V5.6 Distrust of officialdom

V5.6.1 Source

The three items of the scale measuring the "lack of trustworthiness of traditional sources of information" were taken from van der Linden et al. (2021). We substituted the nine-point scale used by the authors with a five-point scale: Strongly disagree—Disagree—Neutral—Agree—Strongly agree.

V5.6.2 Items

Please indicate for each of the statements to which degree you agree or disagree with them.

- **DO1+**: I'd rather put my trust in the wisdom of ordinary people than the opinions of experts and intellectuals.
- **DO2+**: When it comes to really important questions, scientific facts don't help very much.
- **DO3+**: We believe too often in science, and not enough in faith and feelings.

V5.7 Conspiracy Mentality

V5.7.1 Source

The five-item Conspiracy Mentality Questionnaire (CMQ) was taken from Bruder et al. (2013). Responses were given on an 11-point scale: 0% certainly not—10% extremely unlikely—20% very unlikely—30% unlikely—40% somewhat unlikely—50% undecided—60% somewhat likely—70% likely—80% very likely—90% extremely likely—100% certain.

V5.7.2 Items

I think that...

- **CM1+**: ... many very important things happen in the world, which the public is never informed about.
- **CM2+**: ... politicians usually do not tell us the true motives for their decisions.
- **CM3+**: ... government agencies closely monitor all citizens.
- **CM4+**:... events which superficially seem to lack a connection are often the result of secret activities.
- **CM5+**:... there are secret organizations that greatly influence political decisions.

V5.8 Climate change skepticism

V5.8.1 Source

Climate change skepticism was measured with six items taken from Lewandowsky, Gignac, et al. (2013) and Lewandowsky, Oberauer, et al. (2013).

V5.8.2 Items

Items were presented in a matrix and answered on a five-point scale (1–5): Strongly disagree—Disagree—Neutral—Agree—Strongly agree.

- **CC1+**: I believe that the climate is always changing and what we are currently observing is just natural fluctuation.
- **CC2-**: I believe that most of the warming over the last 50 years is due to the increase in greenhouse gas concentrations.
- **CC3-**: I believe that the burning of fossil fuels over the last 50 years has caused serious damage to the planet's climate.
- **CC4-**: Human CO₂ emissions cause climate change.
- **CC5+**: Humans are too insignificant to have an appreciable impact on global temperature.

- **CC6+**: The claim that the climate is changing due to emissions from fossil fuels is a hoax perpetrated by corrupt scientists who want to spend more taxpayer money on climate research.

V6 Scales with subscales

V6.1 Social and Economic Conservatism Scale

V6.1.1 Source

The Social and Economic Conservatism Scale (Everett, 2013) consists of 12 items in 2 subscales.

V6.1.2 Items

Responses were given on slider scales from very negative (-100) to very positive (+100).¹

- **SC01-**: Right to abortion
- **EC01-**: Welfare benefits
- **EC02+**: Limited government
- **SC02+**: Military and national security
- **SC03+**: Religion
- **EC03+**: Gun ownership
- **SC04+**: Traditional marriage
- **SC05+**: Traditional values
- **EC04+**: Fiscal responsibility
- **EC05+**: Business
- **SC06+**: The family unit
- **SC07+**: Patriotism

V6.1.3 Item preparation

V6.2 COVID-19 risk perception

V6.2.1 Items

These seven items are presented in Rothgerber et al. (2020) in three groups. Items in each group are presented in their own decision matrix with a six-point scale. The first two groups use scales with end points labeled "Strongly unlikely" and "Strongly likely", respectively. The perceived societal risk is measured on a scale with end points labeled "Strongly disagree" and "Strongly agree." The cited article uses all items as a single scale, but in the context of the study we split the scale into two subscales, namely personal risk perception (including the first four items) and societal risk perception (the final three items).

Perceived personal risk.

- **PPR1+**: How likely are you to become infected with COVID-19... - ...the next few weeks?
- **PPR2+**: How likely are you to become infected with COVID-19... - ...the next few months?

Perceived other risk.

- **POR1+**: How likely are you to know someone who will become infected with COVID-19... - ...in the next few weeks?
- **POR2+**: How likely are you to know someone who will become infected with COVID-19... - ...in the next few months?

Perceived societal COVID-19 health risk.

- **PSR1+**: I believe COVID-19 poses a large health risk... - to my community.
- **PSR2+**: I believe COVID-19 poses a large health risk... - to my state.
- **PSR3+**: I believe COVID-19 poses a large health risk... - to the U.S.

Figure V52

Perceived COVID-19 risk: histogram of scores

V6.3 Threat of COVID-19

V6.3.1 Sources

The ten items of the COVID-19 threat scales are divided into two subscales: a symbolic threat (CT-S) and a realistic threat (CS-R) scale. The items were adapted from

Kachanoff et al. (2021), with the items of the realistic subscale being themselves adapted from the Pew Research Poll, Wave 63.5, March 10, 2020.

Items were presented in two matrices with a four-point response scale: Not a Threat 1—2—3—Major Threat 4.

V6.3.2 Items

How much of a threat, if any, is the coronavirus outbreak for...

- **CT-S1+**: The rights and freedoms of the U.S. population as a whole
- **CT-S2+**: What it means to be American
- **CT-S3+**: American values and traditions
- **CT-S4+**: American democracy
- **CT-S5+**: The maintenance of law and order in America
- **CT-R1+**: Your personal health
- **CT-R2+**: The health of the U.S. population as a whole
- **CT-R3+**: Your personal financial safety
- **CT-R4+**: The U.S. economy
- **CT-R5+**: Day-to-day life in your local community

V6.4 Government response to COVID-19

V6.4.1 Sources

The 12 items of the government response to COVID-19 scale were adapted from Conway et al. (2020). We collapsed the three government levels used in the original study into a single level, substituting "government" for each more specific term, while indicating

that the term referred to the Federal (National) Government. The 12 items form six subscales: Restriction (GR-Rst), punishment (GR-Pun), reactance (GR-Rct), research (GR-Rsh), stimulus (GR-Sti), and informational contamination (GR-Ico). We added a thirteenth item based on our previous study, asking for the attitude towards tradeoffs (GR-Tra).

Items were presented in a matrix with a seven-point response scale, with the two end points labeled "Not true of me at all" and "Very true of me", respectively.

In contrast to all other scales and without intention, there was no response requirement for these items (due to an omitted check mark). Thus, there are missing values for these variables.

V6.4.2 Items

For the following questions, consider "Government" to be the Federal (National) Government.

- **GR-Rst1+**: I support government measures to restrict the movement of American citizens to curb the spread of Coronavirus (COVID-19).
- **GR-Rst2+**: We need strong government officials right now to take action to stop the spread of disease.
- **GR-Pun1+**: I want my government to severely punish those who violate orders to stay home.
- **GR-Pun2+**: It is vital right now that the government strongly punishes people who do not engage in social distancing measures.
- **GR-Rct1+**: I am upset at the thought that my government would force people to stay home against their will.
- **GR-Rct2+**: It makes me angry that the government would tell me where I can go and what I can do, even when there is a crisis such as Coronavirus (COVID-19).
- **GR-Rsh1+**: I think we should spend most of our government resources right now towards finding a vaccine (or other medical cure) for Coronavirus (COVID-19).
- **GR-Rsh2+**: I want to see more governmental research on Coronavirus (COVID-19) because I think that's the best way to stop it.
- **GR-Sti1+**: I think it is a good idea for the government to give individual citizens money back during these difficult times to increase spending and keep business going.
- **GR-Sti2+**: I think a government stimulus package during the virus spread is a good idea.
- **GR-Ico1+**: I distrust the information I receive about the Coronavirus (COVID-19) from my government.
- **GR-Ico2+**: I think the government has an agenda that's causing them not to give the whole story to the populace.

- **GR-Tra1+**: I think that the health of the economy is more important than the health of a small minority of vulnerable people.

V6.5 American response to COVID-19

V6.5.1 Sources

The 14 items of the American response to Covid-19 scales were taken from Pennycook et al. (2021). The items form two subscales: An evaluation of the presidential COVID-19 response (ARC-P), and an evaluation of the national COVID-19 response (ARC-N).

Items were presented in two matrices with a seven-point response scale: Strongly disagree—Disagree—Somewhat disagree—Neither agree nor disagree—Somewhat agree—Agree—Strongly agree.

V6.5.2 Items

Please read each statement and decide how much you agree or disagree with that statement.

- **ARC-P01+**: President Trump accurately understands the level of danger posed by the coronavirus.
- **ARC-P02+**: President Trump is a good source of information regarding the coronavirus.
- **ARC-P03+**: President Trump knows what needs to be done to mitigate further spread of the virus.
- **ARC-P04+**: President Trump is doing his best given the information that he has.
- **ARC-P05+**: President Trump is doing all he can do to prevent further spread of the coronavirus.
- **ARC-P06-**: President Trump is handling the coronavirus poorly.
- **ARC-P07-**: President Trump should have done more, sooner, in response to the coronavirus.
- **ARC-P08-**: President Trump was too slow in his response to the coronavirus.
- **ARC-P09-**: President Trump has underestimated the risk of the coronavirus.
- **ARC-P10-**: President Trump is failing in his job to keep the nation updated with accurate information.
- **ARC-N01+**: America is the most prepared nation with respect to the coronavirus outbreak.
- **ARC-N02+**: America is the most equipped country to deal with the coronavirus.
- **ARC-N03+**: America is being more proactive than other countries with respect to the coronavirus outbreak.
- **ARC-N04+**: America did more to prevent the spread of the coronavirus than other countries.

V6.6 Behavioral intentions

V6.6.1 Sources

The twelve items measuring behavioral intentions are organized in four subscales and adapted from multiple sources: The face covering subscale (BI-FC) was adapted from Capraro and Barcelo (2021). The three item texts are copied verbatim, the first part of the

sentence is different. Items BI-HH2+, BI-HH3+, and BI-MR3+ were adapted from Jordan et al. (2021). The remaining items were adapted from various government guidelines and public health webpages (see, e.g., Lockerd Maragakis, 2020)

Responses were given on a slider scale with values from -50 to 50 (with numeric and line markers for every 10-point interval). The two extreme points were labeled "Strongly disagree" and "Strongly agree", respectively, the midpoint was labeled "Neither agree nor disagree".

V6.6.2 *Items*

In light of the coronavirus outbreak, I intend to...

- **BI-MR1+**: ...leave my home only for essentials.
- **BI-PD1+**: ...avoid face-to-face interactions with friends.
- **BI-PD2+**: ...engage in physical contact with no one other than those I live with.
- **BI-MR2+**: ...self-quarantine if feeling sick for a minimum of 14 days.
- **BI-HH1+**: ...wash my hands regularly for 20 seconds.
- **BI-HH2+**: ...stop shaking other people's hands.
- **BI-HH3+**: ...try my hardest to avoid touching my face.
- **BI-MR3+**: ...try to stay home whenever possible, even if I am not sick.
- **BI-PD3+**: ...remain at least 6 feet away from other people.
- **BI-FC1+**: ...wear a face covering any time I leave home.
- **BI-FC2+**: ...wear a face covering any time I am engaged in essential activities and/or work, and there is no substitute for physical distancing and staying at home.
- **BI-FC3+**: ...wear a face covering any time I'm around people outside my household.

V6.7 Cognitive Reflection Test (CRT)

V6.7.1 Source

Participants responded to four items measuring cognitive reflection (Frederick, 2005). Three items were taken from the CRTt (Woike, 2019), the final item from the CRT 2 (Thomson & Oppenheimer, 2016).

```

scaleFrameCRT$CRT02int <- dplyr::recode(scaleFrameCRT$CRT02cat,
                                     "intuitive"=1, .default=0)
scaleFrameCRT$CRT03int <- dplyr::recode(scaleFrameCRT$CRT03cat,
                                     "intuitive"=1, .default=0)
scaleFrameCRT$CRT04int <- dplyr::recode(scaleFrameCRT$CRT04cat,
                                     "intuitive"=1, .default=0)

scaleFrameCRT$CRT01correct <- dplyr::recode(scaleFrameCRT$CRT01cat,

V7 Qualitative Data

Here, we list a selected sample of open-format answers to the questions asked throughout the survey.

V7.1 Messages to players choosing risky and safe options

Nr.	Message to safer players	Message to riskier players
1	Nice teamwork	You must be bold
2	Welldone	You put everyone at risk of losing
3	y'all are being conservative	My fellow risk takers, I say hello
4	Good move	Bigger move
5	Thank you for doing your part to keep us safe.	After more time had passed you should've been more careful
6	You did well	Why would you do that?
7	Thank you for trying to protect the group	I understand why you might want to gamble for the larger bonus
8	They cared about everyone's well being	They cared more about themselves
9	Foolish and timid	Brave and intelligent
10	take risk	try not to take too much risk
11	You made the unselfish choice. Good job!	I understand where you're coming from, but you endangered the prize money of everyone else, and also made it likelier that you'd receive no prize money at the end.
12	That an overly cautious approach is not the best strategy. That a lot of players are going to count on others being overly cautious.	It is probably a sound strategy because one can expect people to be very cautious in playing this game. Do pick G from time to time but expect others to try to minimize loss more than maximize gain.
13	I'd say that you were taking a hit and making what I would consider the right decision to make a consistent bonus. It may not be the most, but you're giving everyone a chance to walk away with more than what the study was giving.	I'd say that this was very risky and that you were taking everyone down with you by giving more of a chance to lose out on the bonus.
14	Pointless to choose G early in the game	Smart to choose option H until end of the game.
15	Thank you for thinking of others.	To each their own.
16	Are you afraid to take risks?	Its good to be brave
17	That's not a very good plan.	That's not a good plan. It must he switched up every once in awhile.
18	You made the safe decision.	You're brave for choosing option H.
19	need to take a risk sometimes	too much risk is not good
20	Why go for less points?	Glad to see you gambled
21	You my sir, are an MVP.	Well, I dont blame you.
22	samsies!	Probably just tease them playfully. What the heck man? Why so greedy?
23	Thanks for playing the game correctly	I bet you also lick doorknobs during this pandemic, don't you?
24	Good job boosting our odds	You are a greedy simpleton
25	we will all die anyway	and now what?
26	I feel like this was the safe bet to keep yourself blue.	I don't blame you! We've all got bills to pay!

Table V1

Selected messages for safe and riskier players (messages in each row were sent by the same participant.

V7.2 Comments regarding the injunctive-norms message

- The message was a guide
- Message well delivered
- It helped me to think of the consequences of my choices.
- I think it's an oversimplification, but gets the general idea across.
- The message made a lot of sense
- A message that can save someone
- Thank you
- The message influenced me
- It was a nice reminder of the risks
- The message really helped me make the decision
- I would have chosen G most of the time anyway, but hope that it influenced other people
- The message was reminding me of the risk of choosing H
- I can't say for sure that I would have but I probably would have chosen H for the points. It added a bit of guilt to the whole game, which influenced my decision.
- I already had a plan before the message that I stuck with.
- The message didnt affect me in any way
- it definitely influenced my decision
- The message had a big influence.
- It really had a huge impact on how I played the game.
- It didn't really mean anything to me
- I agreed with it. I didn't want to take the risk!
- The message made me more risk averse in the game.
- I felt pressured into choosing action G.
- the message is loving
- Helpful.
- It was a nice reminder to make some people think about the big picture

- go blue
- It's pushy, but encouraging. It might shame people into helping others.
- It made me rethink how I was going to play the game.
- It's a good message, although some users may be skeptical and think shenanigans are going on.
- I liked that it was blue
- I found the message to be a helpful reminder, it didn't really affect how many times I picked G vs H
- a little persuasive
- It is like wearing masks - you do it to protect others and the risk and inconvenience for yourself is minimal.
- It seemed like both a threat and a warning
- Overall it was fine, I don't think it changed my approach though. I prefer to make my own decision rather than be told what to do.
- I anticipate a lot of people will choose option H only because they want to defy the message.
- I liked the reinforcement
- I mostly ignored the message
- I think the summary was simple and really forces people to think about the other players.
- It served as a reminder to try and not click H everytime.
- I couldn't tell if the message was just a mind game or not
- It was slightly aggressive
- It seemed like stating the obvious
- I appreciated the prosocial spirit of the message.
- I was surprised you made it so obvious and spelled it out but that was probably part of the point
- It spoke to my personal values of wanting equality for all.
- It was good to protect peoples extra money and i like that a lot
- I followed the message
- I saw the message but ignored it
- I'm wondering if it had a strong influence on people's behavior.

V7.3 What the game reminded participants of and general game comments

- One of the best game have played online
- This game is fun and interesting
- No comments. All good
- It reminds me of the coronavirus and choice to stay home. Choosing to isolate is less rewarding but helps protect yourself and anyone you interact with.
- It was similar to a prisoner's dilemma, but with no third state to compare against. Additionally, there was no way to guarantee safety, thus making the game impossible to win on a long enough time scale. I almost feel like having an option J which gave you no bonus, but guaranteed you didn't change colors would improve the game from a game theory perspective, although probably not for the purpose of your research.
- It reminds me of The wearing of face masks in public places
- Not really – it's kind of like tag or other games were you get "infected"
- A nice and mind engaging game
- This reminds me a little bit of the way that COVID spreads.
- it remind of the reality of life.one for all, all for one
- Gambling
- dont trust anyone
- No, the game was unique. Not knowing whether I was blue or purple was bothersome. However, I adapted a Pollyanna mindset and assumed that I was blue throughout most of the game.
- It was quite fun! Tapped into some psychology.
- It reminded me of a coin flip game. It was interesting and fun to participate in.
- I am not much of a risk taker when I do not know what type of people I am playing with. So I just chose the safer option so that whoever ends up as a blue will earn bonus points.
- Some NBC (US) game-show. The Wall? I think? At the end a sequestered player makes a decision and another player has to match him/her.
- The game doesn't remind me of anything. I do wonder if I underestimated how many people would gamble by choosing "H". I'd assume that the majority chose "G" on most turns, though I may be totally incorrect.
- I am a cryptocurrency trader and am interested in stocks and day trading, this reminds me a lot of the financial markets when it comes to risking some to get some in return. It was a familiar feeling to taking risks on the financial markets.

- This game really didn't remind me of anything. No comments other than the study was interesting.
- It reminded me of an old game show where the opponent had headphones on behind stage and could not hear your answers.
- I don't there is anything that it really reminds me of with regards to surveys, but it does remind me of board games like I think Go for example, if I'm thinking correctly about that, where the pieces will flip and change color when they are positioned next to another color and players change their piece number throughout the game.
- Honestly, this game made me think of how coronavirus spreads, how if people take a bigger risk with their health, they will regret it and end up losing in the end.
- Not particularly. It reminds me of a game of strategy. Your strategy is competing against many others strategies.
- I liked the game very much. It is very interesting
- I enjoyed this game and am curious about the results. What a fun experiment!
- The whole game reminds me of climate change and electric power. Your nation can use electricity more and benefit, but it hurts other nations because it is bad for the environment.
- No, this is very unfamiliar, like playing blind. I can imagine scenarios, but not actually identify a particular experience that would compare to this. I have done other surveys in the past involving decision making games with either other real or algorithmic, or made-up players, in which the outcome would not be known until afterwards, for a potential bonus. So in that way, there is an obvious comparison, but none of those scenarios were just the same as this one. The degree of responsibility for other players, actual or implied, was more explicit than in this one, as I remember. It makes me think a little bit of betting on horse races based on speculating upon information from a newspaper rather than at the race, but I have never done that, either.
- This game reminds me of the current Coronavirus situation and whether people would wear masks. Wearing masks all the time is equivalent to chooses G every single time.
- This game reminds me of the political ideology socialism.
- I have not experienced anything like this game before. I'm interested to find out if I stayed blue or not! This was such a cool study to be a part of.
- Reminds me of gambling and/or buying risky investments.
- I can't put my finger on the name of the game this survey reminds me of. Thank you for giving me the opportunity to complete this. It was very interesting.
- It is similar to the risks we take in life. Usually they don't work out, but when they do, the reward is large.

- It reminds me that people will choose what is best for them before prioritizing someone else. It reminds me of moral questions with no fair answer.
- covid 19 wearing a mask to help save others
- its was one after like that, my coworkers and i were working on a project which determine who get more bonus or less by becoming the best.
- It makes me think how people make decisions for themselves, which I did not do during this game. I went with the message every round.
- Everything was clear and fantastic.
- So many rules for such a dumb game. Sorry :/
- This reminds me of those Friend or Foe gameshow. If both select friend, you share the money. If one does Foe, they steal. If both do Foe, neither get money. To me, I would always take Friend so that money is guaranteed to one person. My strategy was to do 5 H in the beginning, because there was a smaller chance of people being purple. By round 6, there was surely many more purples so I stuck with G in the hopes that I could survive to the end as blue.
- The likelihood that anyone remained blue at the game's conclusion is near zero. Thank you for offering a game to which no real "bonus payment" is conceivable.
- The spread of anything (at the moment COVID-19). People tend to chose higher reward over caution and helping others.
- The only thing this game reminds me of is that I would like to review and relearn statistics and probability theory. It wouldn't have made in difference in what I chose in the game, but I am curious about the odds of turning purple.
- Well I did play a game theory thing with some friends like this once. I was the only one who didn't press the button, so I died. I wouldn't be surprised if everyone is purple by now
- It reminds me that we should care about others.
- really silly/dumb/annoying. all the rules. we know we weren't paired with anyone. researchers never pay large bonuses so it relaly doesn't matter. maybe if you do it again, less rules and have a "bigger payout" even though you won't pay out.
- As with all cooperative games, you just hope that a few assholes don't screw it up for everybody.
- It reminds me of the current situation in this country with some people working to be fair to everyone and others out trying to get all they can get for themselves.
- Mask wearing and social distancing to prevent and minimize the spread of Covid 19.

- Coronavirus. Seems like the people who have it and don't care spread it to others who might unknowingly spread it to even more people.
- Overall this reminds me of game theory, just a more dynamic version. Each individual is better off individually choosing H (more points), but in doing so would be penalized at a higher rate. The cooperative solution gives each person less, but is much less risky. Very cool study! Interested to learn how I did and the breakdown of when things changed if at all!
- This game was very difficult since you are absolutely blind and have no idea if you are actually going to get money or not.
- Kind of reminded me of deal or no deal. People making decisions that could harm themselves out of a desire for more cash
- I'm not normally a risk-taker, but I took a calculated risk this time. I figured everyone is needing money at the moment and they would throw it all in as well. When I play slots at the casino, I'm a very low risk taker. I go in with a set amount of money, and if I lose it all, I walk out. If I win the amount back, I will pocket that money and possibly play any winning monies.
- It kind of reminded me of the card game Mafia, just in that the surviving group always dwindles at some point.
- It's a teamwork game.
- Sometimes when I play the slots I start off trying to be conservative in spending, but when I realize that I've started winning, I tend to bet more. I used a similar approach in this game by choosing safely first (testing the waters), and then I began to take a risk of the higher amount. I thought I might have regrets if I didn't try and win.
- I believe this may be meant to test how risky people are willing to behave while covid19 is going on.
- I'm assuming you are making a comparison between the game and the participants' attitudes towards conservatism and risk taking. There is an analogy here between the test and behavior during the pandemic.
- I have not done anything like this but it was very interesting and I'd like to know more about the information the creator gets from this.
- I sort of suspect it's like a coronavirus simulation - are you willing to inconvenience yourself/lose money in order to try to prevent "infecting" other players in the game?
- It reminds of Halloween as a child where a house put out a bowl of candy with a sign saying "please take one" and watching the kids who would just take one so others could have some until inevitably one kid would come along and dump the whole thing into his or her bag. In this scenario, I figured there would be those that would only care about their own outcome.

- Somehow, this reminds me of wearing a mask during the current COVID-19 pandemic and assessing my own risk tolerance in relation to those who may not be as keen about upholding social norms or standards.
- it kind of reminds of the spread of a virus. You want to go outside, go shopping, be around people, etc. but want to avoid spreading your sickness/getting sick. If you choose to be risky then you will probably get sick but if you wear a mask, keep away from people with symptoms, etc. you probably won't (but it's still possible).
- I wanted to keep my risk as low as possible and then take a couple shots at the end. I hope it didn't hurt me!
- It doesn't remind me of anything else I've done before.
- It feels like a study on capitalistic ideas.
- Not really its a pretty unique game
- This reminds me of a little bit of the prisoner's dilemma, just a little bit. I remember watching a British game show that riffed off from this theory, and that it would benefit everyone if they chose the lower option to get the reward that benefited the greater good. Most of the time, I might choose to do that, but what made me risk it all was the length of the game. Even if I chose option G the entire time, the likelihood that I wouldn't be purple by the end of the game was low regardless. So I decided instead to risk it all for the very small chance of the highest possible bonus. Probably the biggest factor in my decision though was the initial reward of 3 pounds for playing the game regardless. In the original experiment, I believe there is a chance that you will receive nothing, and I think having compensation for an experiment like this made me feel like the stakes were lower and I would get money anyways.
- Most games that are similar to this result in players playing in their own interest (e.g. selecting H most of the time). It would be interesting to see what the results are and what color I end up.
- I don't think I've ever played anything similar to this before.
- I've never participate in something like this before so It's very interesting. I would love to know what other people have chosen.
- This game is an interesting social experiment to compare selfishness vs the benefit of the group
- Yes, this game reminds me of man's quest to accumulate more profit at the detriment of others.

V7.4 Perceived differences between game and pandemic

- COVID-19 involves the whole world while the simulation involves 100 people
- I can't find any similarity

- There was no part that was different.
- People who isolate and then hang out 1 on 1 vs people who don't.
- covid-19 is ravaging the world but this is just a survey
- There was a great similarity between the simulation and COVID-19
- In simulation I can,t become blue, but in COVID-19 i can become negative.
- I can't really say, probably his money is involved. Though I get that, you need to see how or if people put others before themselves
- Those who don't wear masks and don't socially distance don't stand to gain anything significant by not doing so, so that does not reflect the game.
- I would say that the risk to turn purple is probably a lot lower in this game than the actual rate of transmission in real life. Aside from that, I feel it was pretty similar.
- Some people don't get a choice in the real world if they have higher risk of exposure if they want to pay their bills.
- None. It is the true picture of Corona virus situation
- Earning money instead of safety, risk of losing money vs losing life, no chance of social distancing to purposefully not interact.
- Well, it's a novel virus with more and more testing coming in every single day. So, I'm not sure we can assume the chances of contracting it. Also, how does money play into risk? I can't think of a scenario where taking on the risk of contracting covid is going to pay you. I guess the freedom of being out and living your life is some sort of payment? I'm not sure. I suppose I see the connection between a couple (who lives together) both taking the risk to getting the virus and not being able to "go back" after the fact?
- With COVID there is a chance of knowing whether you have it or not, in this game you don't know whether you're purple or not.
- I wasn't in any actual danger. In real life, you experience the fun of living life, but may contract the disease and could die or have lasting effects. During this game, you received only a positive, but did not risk losing something only not gaining something,.
- The odds of someone getting severe consequences from COVID are much more slim than the stakes of this game. E.G., a higher percentage of players will turn purple than get the virus.
- The is risk of contracting COVID-19 if we want to enjoy certain benefits
- Money and a virus are very different subjects. I have no problem with trying to protect other peoples money because it's a hard asset that is tangible and provable, a virus can be easily misunderstood.

- If blue is uninfected and purple is infected then this would represent social encounters and the chance of the transmission of COVID-19
- You can insulate yourself from others choices (wearing PPE) in the COVID situation...not in this game.
- Nobody dies
- Government rulings
- There is a lot more movement in real life. A person won't always be just in a pair.
- The game does not take into account other factors that the virus does. i.e. Whether a person is outside or inside, if the sun is out etc.
- the more interactions a decisions made the higher the probability that the color changed - just like the more interactions with other in the covid world the higher the probability that you could get the virus too
- After the connection was made I find a strong connection. Although some of the percentages in this experiment might be higher than that of Covid sharing I see the connection.
- The fact that in COVID-19, certain individuals are more affected than others (due to race, age, pre-existing conditions, etc.). So not everyone starts out blue.
- I feel the variables in COVID-19 are more complex, for example, one might be exposed to droplets of contagion without actual contact with an infected person, through discreet modes of transmission from random surfaces or even from persistent aerosols, such as through ventilation systems, even with reasonable precautions observed.
- The way I am thinking about it, everything matches up perfectly. The benefits are like businesses that open up and don't do social distancing. They make more money but increase the risk.
- There's no quarantine option and you can "go back to blue"
- I don't really know but it's all making sense now.
- Coronavirus is not randomized and anonymous, which changes the dynamic entirely.
- COVID is a real life, dangerous situation. The simulation is just a harmless game.
- The fact that it's colors and not people, and that I had no choice in controlling "my color", even though I definitely have a choice in controlling "my life". I could choose to stay inside the entire time, and then my chances of full bonus payment would be close to 100
- The virus has real-life consequences far greater than this simulation. I have lived the past few months in G-land.

- one is a game and one is a disease killing hundreds of thousands
- Some people who get sick do not have symptoms and are not bed ridden so technically they still get the reward while also messing up other people
- It doesn't account for age, distance between people, masks, etc. And the contagious rate would seem too high at 5%-25%
- Covid is real and kills people. This game doesn't.
- The 8/100 infection ratio of the game does not reflect the 12/100 infection ratio of Covid-19 in my community.
- Well, in reality, it is true that we don't know whether we have the virus or not, but that doesn't mean that we are all eventually going to swarm restaurants, beaches, etc and become purple heads lol Some of us actually have self control and healthy working memory unlike a large amount of Americans that would act exactly like this survey (source: <https://www.newsbreak.com/news/1599904390680/people-who-refuse-to-follow-social-distancing-or-wear-masks-may-have-problems-with-working-memory-study>). But in all honesty, it's exactly what a huge population of Americans are doing :/
- If I am right in comparing this simulation to wearing a mask to stop the spread, I think the biggest difference is people might be more apt to select G here (which I am correlating to wearing a mask) for the high chance to win extra money. Positive reinforcement. Whereas I feel like most people don't see wearing a mask as a positive thing, even though it could save a life, but more as a punishment for some reason.
- I don't believe the spread of the disease comes down to individual reactions, but to the actions of the state. That's easily seen in how countries have responded. Individuals have a very minor effect imo
- The factors behind transmission of the coronavirus are far more complex, but the game does a fine job of mirroring the basics of it.
- Some people would know their "color."
- After thinking about it, this simulation was actually the same as the COVID situation when it comes to people not social distancing or wearing masks etc.
- I'm having a hard time wrapping my head around why it even makes a connection at all.
- The social aspect was different. Playing the game did not make me feel the emotions that I would feel giving the virus to elderly parents/grandparents.
- I didn't feel like I was actually hurting someone by the choices I made.
- Obviously COVID-19 doesn't involve winning, certainly not money, it is quite the opposite and deals in lives.

- The simulation deals with colors/bonuses, while the COVID-19 situation deals with life/death. If folks 'don't behave' by being hygienic/socially distancing, the outcomes are much worse in real life.
- If both people wear a mask, there is little/no chance of contracting covid. 1 does and 1 doesn't, medium risk. Both don't, high risk
- Being completely in the dark about who was "infected" is not exactly like reality where we have some statistical numbers indicating danger (but maybe that is still similar)
- there's so many other factors affecting people's decisions related to coronavirus. it's not this simple
- its a game...there is no correlation whatsoever
- It reminds me of wearing masks. If you are safe and wear the mask for yourself and others, then you have less of a chance of one of you catching COVID, but if you are selfish and decide to not wear one, then you risk getting one of you sick
- protecting your family , securing they have enough . Worrying about everything , the stress.
- I believe that this is trying to show how diseases are passed. Purple being the infected people. However Herd immunity has to come into play. This virus will NOT go away just because we are wearing masks and staying away from each other.
- There is nothing to gain from not wearing a mask. Risk does not equal reward.
- I think this situation shows it spreading faster than what it actually does.
- The numbers I have seen for covid transmission are not even close to 5,15,25. I think it's as high as 70 with no masks on both parties.
- Well, we basically are in a bubble with family right now so there's not a chance to interact with potentially 100 people.
- There is no prize to not getting Covid, but there's a cost. A covid comparison would be like if we turned purple, we lost money on our payment.
- Obviously, there was no real risk to players in the game. The bonus money was never their money so they weren't "losing" anything by taking a risk, whereas COVID directly affects everyone in a physical and very real way. I don't think that someone who takes risks in the game is automatically selfish, but people who don't wear masks or protect themselves and others from COVID absolutely IS selfish.
- Well, hopefully no one died in the simulation.
- Life and death is a tad bit different than making an extra few cents.

- The incentives are different. The incentive in the game is to earn money but the players who are "purple" or "infected" do not necessary lose anything. In the corona virus situation, the purple or infected are losing out on things - their health, their jobs, and even their life. There is more incentive in the corona situation to consider others versus in the game.
- there is not much difference since choosing option G means you are taking less risk to protect your team players. This can also be linked to practicing social distancing, washing our hands frequently etc inorder to protect others

V7.5 Comments at the end of the survey

- The study is exceptional
- All is well organized and interesting and looking forward to do more next Time
- This is a very long study
- I am glad to be part of this survey. It found it educative and interesting.
- Good Questions and somewhat difficult tasks
- It was amusing!
- Really loved how you passed a message with this study on the covid 19 situation with wearing of masks.
- Behavior of the media, congress, democrats, left, liberals against Donald Trump is down right disgusting. NO President should ever be treated this way. There are so many that should literally be jailed and behind bars right now and THEY KNOW IT. The lying, the cheating, the deception, the stealing... this is NOT the American way. They have lost their moral compasses, sold their souls to the devil... so much evil - Bill & Hillary Clinton, Barak Obama, James Comey, Peter Strzok, Lisa Paige, Bruce Nellie Orr, James Clapper, John Brennan, Andrew McCabe... the list goes on and on... they all should be in jail. Corruption has always fueled the Democratic party and it's time for it to stop. It's amazing Hillary doesn't spontaneously combust from her own bull sh*t!
- The questions about the vaccine are ambiguous, since the various vaccines being tested in clinical trials do exist (despite not being FDA approved or widely available)- hence we do have vaccines (existence is inarguable) it's just level of efficacy, safety, production, and distribution that we might opine on. Likewise, my opinion on whether people understand the importance of the United States could be ambiguous. I feel nationalist people misunderstand the importance of the United States by vastly overestimating it, and in this current climate we have very much nationalism.
- Noting position may be helpful. I work in healthcare so I have to follow healthcare rules for social distancing and self-quarantine(not just staying home for 14 days after any illness). It is impossible that I stay six feet from others but I can reduce my amounts of contact with others otherwise.

- There was a question earlier in the study that asked if I felt President Trump underestimated the threat of Covid-19, and I selected "Strongly Disagree" which might seem contradictory to my other answers, but the reason I chose that is because I believe you can't underestimate something if you never properly estimated it in the first place. And I truly believe he has never really grasped the full scale of it all. Thus my selection.
- I got a little confused on the currency exchange in the qualifying section at the beginning, but this has been a very good, eye-opening survey. Thank you!
- This felt disingenuous. I never felt as if I was actually playing the dot game with anyone. Also, it felt like there was a potential of a forced outcome with the questions. Thoughts about the US was a bit too vague. I feel that the citizens of the US should recognize that we live in a truly unique place with a lot of individual potential. However some of the wording seemed to focus more on ALL people knowing how special the US is. I honestly don't really care what certain countries feel about the US...that's their business. There was no way to really reflect that in some of the questions. Also, in regards to religion. There were questions about it and how much it means to me or how important it is. I personally am religious on a very private and individual level (after being Atheist for most of my life) but I don't find it that important to ME. However, I find it HUGELY important that the US continue to be a place where people can practice their religion freely (so long as it doesn't encroach on other people's freedoms). There didn't seem to be a way to reflect that either.
- Too many questions about President Trump and not enough about the real villains in our Nation, the Congressional Democrats and the "News" Media. Maybe next time ask about how we feel about those things. Thanks.
- I feel like when other countries speak of the United States and their citizens, and think them all universally foolish, selfish, etc. it's a bit irritating. I just hope that when they say these things, I hope they mean a lot of the white americans, because most marginalized americans, such as Black Americans, Indigenous people, and other POC are often not in a position to benefit from the selfish and shameless actions that happen in this country.
- Very interesting survey and interesting comparison between the game and current day events. Your results should be interesting! The attention checks were a bit challenging. Being a math person I enjoyed them, although it did take a lot of brain effort to think about. The one about the golden bat and ball did not seem solveable, so I put none of the above. If the bat costs \$4,000 more than the ball, both cannot equal \$5,000. If ball was \$1,000, (because $4,000 + 1,000 = 5,000$) and the bat was 4,000 more, than the bat should have cost \$5,000, which would mean both would equal \$6,000. Not sure if the question was meant to be a trick question, but I would like to bring that to your attention in case it was a typo. :) (And I don't want to be flagged for failure to pass an attention check. I'll message you about this as well, just in case. Thank you!)
- Those lateral thinking questions that popped up between the tasks seemed unnecessary. Almost all the people who do Prolific studies have encountered these same

questions before, so they're not really an accurate measure of reasoning skills.

- Another analogy to the blue ball game and the purple game are vaccinations. Since you can stand to benefit when everyone vaccinates themselves (option G) except you (option H), but if everyone has that same line of thinking then it reduces the effectiveness of vaccinations.
- Wow, was quite cognitive
- This was.... meandering.
- Thank you! It was long but I had fun answering considering how deep and serious were most of the questions.
- I am a doctor and touch 50+ sick people a day, so I take many risks and will likely get coronavirus despite being very risk averse in general. This will affect my responses.
- Everything was nice and clear. The presentation was very nice.
- The font/ text needs to be darker. I get a headache from this light font
- It feels almost as if this study is trying to determine the relationship between personal intelligence and political affiliation. Perhaps to better understand the thought process of each individual and how it relates to political and societal issues.
- You made me whip out a pen and paper on some of the word problems because my intuition is always wrong on those. Overall enjoyable survey, thank you.
- This was very clever but perhaps a little long
- I'm a socialist and I don't know math. Please don't be too hard on me for not getting most of the math questions.
- I don't really have much to comment on. Thank you for the chance to take the survey. I appreciate the chance to do so especially in a financially difficult time.
- Interesting questions. Survey slightly longer than expected.
- I believe that I had Covid-19 in June when other members of my household tested positive. Yet, scientists are not sure whether or not we can be infected more than once. I am still concerned about this virus.
- I think the games in the survey, the first one relating to the infected and healthy person was interesting and really did make me think about the COVID 19 situation occurring right now.
- Too little pay for how long this took....
- This was enjoyable to take part in!
- I feel like I will think about other people a little more financially for now on.

- Great survey, this is my favorite survey I have ever took. I hope I'm not infected.
- Very well put together and does a great job at making you really think about some of the questions.
- I wish the pay was a little higher it was pretty long
- Just found this survey to be very interesting and relatable!
- This was a very unique, thought provoking and somewhat challenging survey. It challenges one's thinking, decision making, and thought processes.
- Thanks for the super interesting survey! I'd love to do more!!! Very creative I must say!
- Lots of false dichotomies in worldview sections
- This was a lot of fun. I hope you collect really good info from people that helps you to do good in the world. Please take care of you :-)
- so fucking long. so confusing. so dumb. shame on you for such a low payout for so many damn questions; and trivia/quiz questions at that. come on guys!
- I love my Country..... That doesn't mean I blindly believe everything the Government tells me.
- It was fun. I especially enjoyed the puzzles
- Very interesting survey. It had me think about my views on subjects I ever thought about before.
- I am very curious to find out the results. Survey was a bit long but well done and thorough.
- I support the general idea of the government imposing coronavirus-related restrictions to keep people from dying, but I don't really trust the Trump administration to actually do that and not just use it as an excuse to brutalize protesters or something.
- I go walking very early each morning, and I don't wear a mask as I can easily socially distance the few people I'm likely to meet. Wording of the questions is a bit problematic. I would never go to a store (or even a drivethru) w/o wearing my mask, but strictly speaking (it would seem) I'm didn't meet your suggestions of "always" wearing a mask.
